SECURITY UPDATES

NEW

New Features

- **Email A/B Testing**

Test two versions of an email against a sample of your audience, then send the winner to everyone. A guided two-phase flow with a manual approval step, available across all email providers.

- **Manage Blocked Communications**

A new admin area to view and manage your blocked-communication list — add, edit and remove entries, and import or export the whole list.

- **Object-Linked To-Dos**

To-Do items can now be attached directly to individual flows and selections, and they travel with them through import and export.

- **Restore a Flow to an Earlier Version**

From a flow's history you can now restore it to any previous saved version, rolling back unwanted changes with confidence.

- **E-Signing (Scrive) — Allow PDF Download**

A new toggle controls whether signing parties can download the PDF during a Scrive signing flow, for finer control over each signing.

- **SharePoint Upload Destination**

The Microsoft Graph action can now upload files directly to a SharePoint URL destination, with improved site lookup.

- **Kivra — Interactive Letters**

The Kivra action now supports interactive letters, with updated guidance for building responsive content.

- **GenerateJson — XML Output**

The GenerateJson action can now produce XML output in addition to JSON, for integrations that expect XML.

- **Ciceron — External Case Reference**

Ciceron cases can now carry an external reference, making it easier to tie them back to your own records.

IMPROVED

Improvements

- **Flow Editor — Box Usability**

A batch of editor refinements: a clearer participant list, a live in-place editor for Split boxes, and quicker Add-box buttons.

- **Faster Scheduling & Smoother Concurrency**

Action scheduling was streamlined and participant searches no longer block one another — giving higher throughput and less contention on busy installations.

- **Richer Built-in Action Documentation**

The reference documentation shown for actions in the flow editor is now automatically generated and more complete.

FIXED

Bug Fixes

- **Service Stability**

A rare logging fault could stop the service; it is now handled safely.

- **Metadata**

Prevented data corruption when metadata is switched during a slow load.

- **Flow Processing**

Participants with empty or legacy key columns no longer interrupt processing.

- **Matching**

Participant membership is re-checked in the slow-match path for accurate results.

- **Import / Export**

Re-importing a just-imported package no longer shows false "changed" differences.

- **Import Safety**

Flows can no longer execute while an import into their environment is in progress.

- **Authentication**

Misconfigured OIDC sign-in connections are now skipped cleanly instead of causing errors.

- **Scheduling**

Time-lapse schedules now re-arm correctly after a Split dry-run.

- **Sweet CRM Action**

Fixed a crash when reading custom fields of an unmapped type.

- **Flow Deletion**

Deleting a flow no longer produces a spurious error about its to-dos.

- **Mobile**

Restored tapping on draggable nodes on touch devices.

- **Real-time Updates**

Fixed a background reconnect loop when a live-updates connection was rejected.

- **Clearer Errors**

A missing condition type now produces a descriptive error instead of a generic failure.

SECURITY

Security

- **Security Dependency Updates**

Several third-party components were updated to address reported security vulnerabilities — including high-severity issues — keeping the platform's security baseline current.

Thank you for using **sweet**
